

Chadar Samaj Matrimony - Live Setup Guide

Yeh document batayega ki aap kaise apne local "data.json" database ko hata kar **Google Sheets** ko apna main database bana sakte hain, aur photos ko internet par save karne ke liye **Cloudinary** ka use kaise kar sakte hain. Iske baad aap Vercel/Render par is website ko mukt me Live (Online) kar sakenge!

Step 1: Cloudinary Setup (Photos Ke Liye)

Jab project live hota hai, toh photos server par save nahi hoti. Hum free me photos upload karne ke liye "Cloudinary" ka use karenge.

1. **Account Banayein:** [Cloudinary.com](https://cloudinary.com) par jayen aur free account banayein.
2. **Dashboard Check Karein:** Login karne ke baad dashboard/settings mein aapko 3 cheezein bhengi:
 - Cloud Name
 - API Key
 - API Secret
3. **Settings Update Karein:** Apne project ke `server` folder me `.env` file ko open karein, aur in teeno values ko waha daal dein:

```
USE_CLOUDINARY=true
CLOUDINARY_CLOUD_NAME=aapka_cloud_name
CLOUDINARY_API_KEY=aapki_api_key
CLOUDINARY_API_SECRET=aapka_api_secret
```

Step 2: Google Sheets Setup (Database Ke Liye)

Hum JSON file ki jagah direct Google Excel sheet me user ka data save karenge.

1. **Google Cloud Console:** console.cloud.google.com par jayen aur apne Gmail se login karein.
2. Ek "New Project" banayein (Jaise: MatrimonyDB).
3. Upar Search bar mein "**Google Sheets API**" likhe aur usko "Enable" kar dein.
4. **Service Account (Jisse Code Connect Hoga):**
 - Left side menu me "Credentials" par jayen.
 - "Create Credentials" > "Service Account" select karein aur account banaalein.
 - Ab us Service Account par click karein > "Keys" tab me jayen > "Add Key" > "Create new key" (JSON select karein).
 - Ek JSON file download ho jayegi. Is file ke andar ek `client_email` aur lamba sa `private_key` hoga.
5. **Apna Google Sheet Banayen:**
 - Apne personal Google Drive me ek nayi khaali (Empty) "Google Sheet" banaye.
 - Upar Share button dabayein, aur uss downloaded JSON file wale `client_email` par Editor ka permission de dein.
 - Sheet ke URL link me se uska **Sheet ID** copy kar lein. (Jaise: `docs.google.com/spreadsheets/d/YEH_WALA_ID/edit`)
6. **Settings Update Karein:** Apne `server/.env` file me apni teeno details daal dein:

```
USE_GOOGLE_SHEETS=true
GOOGLE_SERVICE_ACCOUNT_EMAIL=woh_client_email@xyz.com
GOOGLE_PRIVATE_KEY="-----BEGIN PRIVATE KEY-----\nAAPKI_LAMBI_KEY\n-----END PRIVATE KEY-----\n"
GOOGLE_SHEET_ID=aapki_sheet_ka_id
```

? Google Sheet Database Kis Email Par Hai Kaise Pata Karein? Jab aap local DB (`data.json`) chhod kar Google Sheet use karna shuru kar denge, toh aapka database Google Sheet mein save hoga. Ye Google Sheet ussi Gmail (Google account) par hogi **jisse login karke aapne Step 2.5 mein sheet banayi thi.**

Isse check karne ya database open karne ka tareeka:

1. Apna woh normal Gmail account login karein (jisme aapne upar wali Sheet banayi thi).
2. Apne browser mein sheets.google.com likh kar open karein.
3. Wahan aapko aapki banayi hui Sheet dikh jayegi.
4. Usko open karte hi aapko `users` , `profiles` , aur `reports` naam ki tabs (neeche ki taraf) dikh jayengi jisme sara data hoga!

Step 3: Project Ko Live Karna (Free Hosting)

Jab dono setup ho jaye, to aap code ko free me online live kar sakte hain!

1. **Github Push:** Apna pura code [Github](#) par add and commit karke push karein.
2. **Backend (Server) ke liye Render.com:**
 - [Render.com](#) par account banaye, "Web Service" banaye, apne Github se connect karein.
 - Root Directory `server` dale.
 - Environment variables (ENV) me woh saari keys aur IDs paste/add karden `.env` file wali.
3. **Frontend (Client) ke liye Vercel.com:**
 - [Vercel.com](#) par login karein, project import karein, Root Directory `client` select karein.
 - Build command me `npm run build` automatic aa jayega.
 - Waha ek Environment Variable add kare jo Render wale Backend URL ko point karega (API call ke liye).

Badhai Ho! Ab aapki Matrimony website Live ho chukti hai aur data sidhe Google Sheet par aayega!
